

## Extra Concepts

State vs Props :-

	State	Props
Use Case	State is used to store the data of the components that have to be rendered to the view	Props are used to pass data and event handlers to the children components
↗Mutability	State holds the data and can change over time	Props are immutable—once set, props cannot be changed
Component	State can only be used in class components	Props can be used in both functional and class components
Updation	Event handlers generally update state	The parent component sets props for the children components
