

Single-Page Application

An SPA (Single-page application) is a web app implementation that loads only a single web document, and then updates the body content of that single document via JavaScript APIs.

This therefore allows users to use websites without loading whole new pages from the server, which can result in performance gains and a more dynamic experience, with some tradeoff disadvantages such as SEO, more effort required to maintain state, implement navigation, and do meaningful performance monitoring.

Single Page Applications are **web applications that load a single HTML page and only a part of the page instead of the entire page gets updated with every click of the mouse.**

Angular Routinglink

As users perform application tasks, they need to move between the different views that you have defined. To handle the navigation from one view to the next, you use the Angular Router . The Router **enables navigation by interpreting a browser URL as an instruction to change the view.**

What is ng?

ng is an abbreviation of **Angular**.

NG also means next generation of html.
