

Components

Components let you split the UI into independent, reusable pieces, and think about each piece in isolation. This page provides an introduction to the idea of components.

Conceptually, components are like JavaScript functions. They accept arbitrary inputs (called “props”) and return React elements describing what should appear on the screen.

There are two types of components: -

(1.) Function Component

```
function Welcome(props) {  
  
  return <h1>Hello, {props.name}</h1>;  
  
}
```

(2.) Class Component

```
class Welcome extends React.Component {  
  
  render() {  
  
    return <h1>Hello, {this.props.name}</h1>;  
  
  }}  

```
